PLAIN MRI & MRA/ MRV STUDY OF BRAIN

Findings : Reference: Case of migraine with change of character. TECHNIQUE: FLAIR Axial, T2 Cor & Ax, T1 Sag & Ax DWI, GRE T2*, MRA /MRV, B-FFE 3D axial FINDINGS: No altered MR signals in brain parenchyma. No areas of diffusion restriction. No gross or petechial parenchymal haemorrhage. No demonstrable space occupying lesions. No empty sella. Bilateral perioptic CSF spaces appear normal. Right posterior inferior cerebellar artery (PICA) is forming a loop in right cerebellopontine angle, indenting the cisternal portion of right 7th nerve. Bilateral cerebral hemispheres show normal parenchyma and gray white differentiation. Ventricles and CSF spaces appear normal. Bilateral capsular tracts appear normal. Bilateral basal ganglia and thalami appear normal. Sella and parasellar regions appear normal. Cerebellum and brainstem appear normal. Visualized orbits, mastoids and paranasal sinuses are normal. Skull vault & base appear normal. MRA of circle of Willis: Bilateral cavernous & supraclinoid ICA, MCA, ACA, PCA appear normal. Bilateral vertebral (V4) and Basilar artery appear normal. No stenosis/intraluminal abnormalities noted. MRV: Superior sagittal, straight sinuses, bilateral transverse and sigmoid sinuses appear normal. No thrombus/filling defects or stenosis noted. Superficial and deep cerebral veins appear normal.

Impression : Plain MRI & MRA/MRV study of Brain done on 11.03.2020 shows, -No significant abnormality in brain parenchyma. -No demonstrable space occupying lesions. -No empty sella. Bilateral perioptic CSF spaces appear normal. -Vascular loop of right posterior inferior cerebellar artery (PICA) is indenting the cisternal portion of right 7th nerve - Risk of developing neurovascular conflict. -MR Angiogram and MR Venogram – Unremarkable.
